

Ministry of Agriculture
HOW TO CONTROL

WEDELIA

Using Metsulfuron methyl 600g/L Escort

STEPS

1 Weigh escort using 0.3g/L water rate.

2 Mix with water and stir to dissolve granules

3 Fill into Hand sprayer or Knapsack sprayer

4 Spray using personal protective equipment.

Wedelia before treatment.

Wedelia after treatment.

Wedelia is an invasive species that has infested pasture fields, roadsides and vacant land. The creeping perennial plant has become a nuisance to many farmers, thus prompting the Ministry of Agriculture to conduct herbicide trials to determine the most effective herbicide to control Wedelia. The most effective herbicide was Du Pont Escort (Metsulfuron methyl) at the rate of 0.3 grams per liter of water.
